

Clean Water Act §319(h) Nonpoint Source Grant Program

***Continuation of Surface Water Quality Monitoring to
Support the Implementation of the Lampasas River
Watershed Protection Plan***

TSSWCB Project Number 20-11

Revision #1

Quality Assurance Project Plan

Texas State Soil and Water Conservation Board

Prepared by

Texas Institute for Applied Environmental Research
and
Texas A&M AgriLife Research

Effective Period: Upon EPA approval through March 31, 2024

Questions concerning this quality assurance project plan should be directed to:

Lisa J. Prcin
Senior Research Associate
Texas A&M AgriLife Research
Blackland Research & Extension Center
720 E. Blackland Rd.
Temple, TX 76502

Temple, TX 76502

Name: Dr. Raghavan Srinivasan
Title: Principle Investigator

Name: Lisa Prein
Title: AgriLife Project Manager

Texas Institute for Applied Environmental Research (TIAER)

Box T-0410, Tarleton Station
Stephenville, TX 76402

Name: Jeff Stroebel
Title: TIAER Project Manager and TIAER Field Operations Supervisor

Name: James Hunter
Title: TIAER Laboratory Manager

Name: Dr. Mike Machen
Title: TIAER Laboratory QAO

Name: Nancy Easterling
Title: Project QAO and Data Manager

AgriLife will provide copies of this project plan and any amendments or appendices of this plan to each person on this list and to each sub-tier project participant, e.g., subcontractors, other units of government, laboratories. AgriLife will document distribution of the plan and any amendments and appendices, maintain this documentation as part of the project's quality assurance records, and will be available for review.

Section A4: PROJECT/TASK ORGANIZATION

The following is a list of individuals and organizations participating in the project with their specific roles and responsibilities:

U.S. Environmental Protection Agency Region 6 (EPA)

Anthony Suttice, EPA Project Officer

Responsible for managing the project for EPA. Reviews project progress and reviews and approves QAPP and QAPP amendments.

Texas State Soil and Water Conservation Board (TSSWCB)

Thomas (Jett) Preston, TSSWCB Project Manager

Responsible for ensuring that the project delivers data of known quality, quantity, and type on schedule to achieve project objectives. Provides the primary point of contact between AgriLife, TIAER and TSSWCB. Tracks and reviews deliverables to ensure that tasks in the workplan are completed as specified in the contract. Responsible for verifying that the QAPP is followed by the TIAER. Notifies the TSSWCB QAO of significant project non-conformances and corrective actions taken as documented in quarterly progress reports from AgriLife and TIAER.

Mitch Conine, TSSWCB QAO

Reviews and approves the project QAPP and any amendments or revisions and ensures distribution of approved/revised QAPPs to TSSWCB participants. Assists the TSSWCB Project Manager on QA-related issues. Coordinates reviews and approvals of QAPPs and amendments or revisions. Conveys QA problems to appropriate TSSWCB management. Monitors implementation of corrective actions. Coordinates and conducts audits.

Texas A&M AgriLife Research (AgriLife)

Dr. Raghavan Srinivasan, Principle Investigator

Responsible for managing the project for AgriLife. Reviews project progress and reviews and approves QAPP and QAPP amendments.

Lisa Prcin, Project Manager

Responsible for implementing and monitoring LR WPP requirements in the contract and the QAPP. Responsible for maintaining records of QAPP distribution, including appendices and amendments. Responsible for maintaining written records of sub-tier commitment to requirements specified in this QAPP. Coordinates project planning activities and work of project partners. Ensures QAPP is followed by project participants and that project is producing data of known quality. Ensures that subcontractors are qualified to perform contracted work.

Texas Institute for Applied Environmental Research (TIAER)

Jeff Stroebel, Project Manager and Field Operations Supervisor

Responsible for ensuring tasks and other requirements in the contract are executed on time and are of acceptable quality. Monitors and assesses the quality of work. Responsible for verifying the QAPP is followed and the project is producing data of known and acceptable quality. Notifies the AgriLife project manager of particular circumstances that may adversely affect the quality of data derived from the collection and analysis of samples. Enforces corrective action. Responsible for supervising all aspects of the sampling and measurement of surface waters and other parameters in the field. Responsible for the acquisition of water samples and field data measurements in a timely manner that meet the quality objectives specified in Section A7 (Table A7.1), as well as the requirements of Sections B1 through B8. Responsible for field scheduling, staffing, and ensuring that staff are appropriately trained as specified in Sections A6 and A8.

Nancy Easterling, Project QAO and Project Data Manager

Responsible for writing the QAPP, in cooperation with the TIAER PM. Responsible for coordinating development and implementation of the non-laboratory QA program. Participates in the planning, development, approval, implementation, and maintenance of the QAPP. Responsible for identifying, receiving, and maintaining project quality assurance records. Responsible for coordinating with the TIAER PM, AgriLife PM, and the TSSWCB QAO to resolve QA-related issues. Notifies the TIAER Project Manager of particular circumstances that may adversely affect the quality of data. Responsible for validation and verification of all data collected according to Table A7.1 and QC specifications and acquired data procedures after each task is performed. Prepares project data for submission to SWQMIS, completes the data summary, and transfers data to SWQMIS.

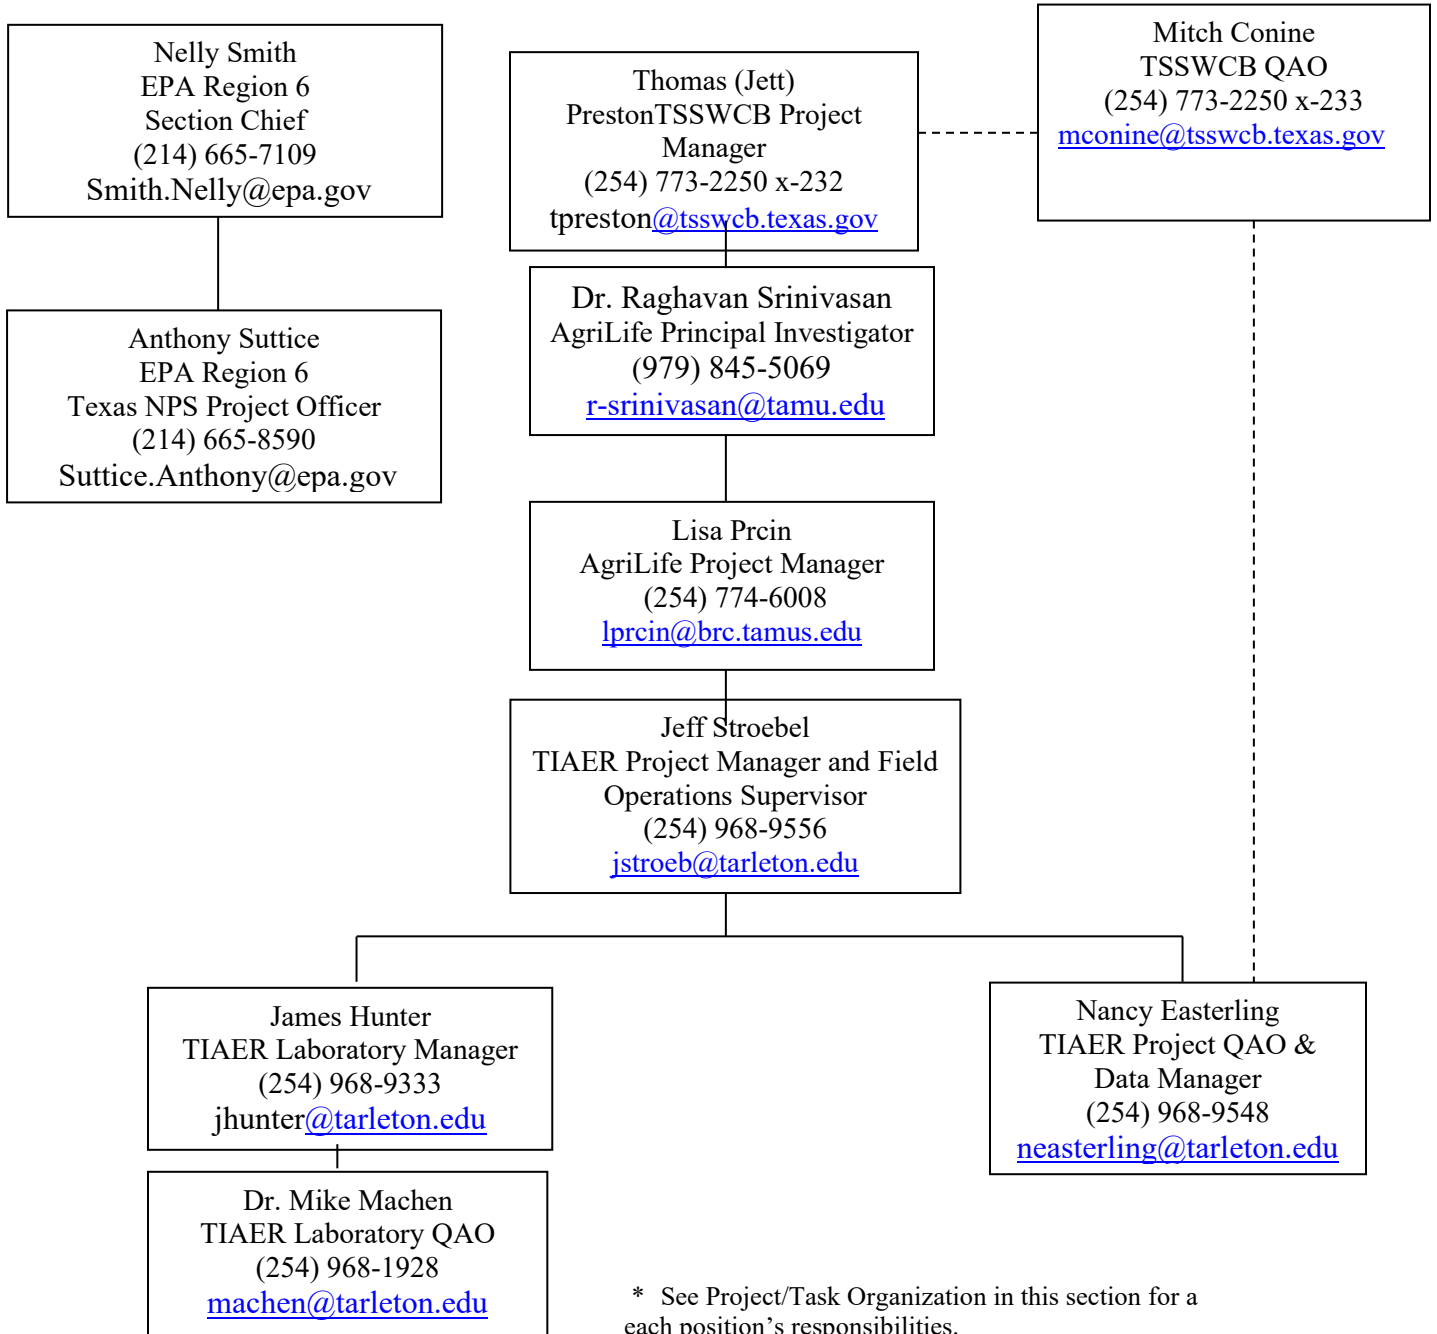

James Hunter, Laboratory Manager

Supervises laboratory, lab safety program, and purchasing of laboratory equipment. Reviews and verifies all laboratory data for integrity and continuity, reasonableness and conformance to project requirements, and then validates the data against the measurement performance specifications listed in Table A7.1.

Dr. Mike Machen, Laboratory QAO

Maintains quality assurance manual for laboratory operations, maintains operating procedures that are in compliance with the QAPP. Responsible for the overall quality control and quality assurance of analyses performed by the TIAER Laboratory.

Figure A4.1 Project Organizational Chart*-- Lines of Communication

* See Project/Task Organization in this section for a each position's responsibilities.

Section A5: PROBLEM DEFINITION/BACKGROUND

The Lampasas River (segment 1217) rises in eastern Mills County, 16 miles west of Hamilton and flows southeast for 75 miles. The river courses through Hamilton, Lampasas, Burnet and Bell Counties. In Bell County the river turns northeast and is dammed five miles southwest of Belton to form Stillhouse Hollow Lake (Segment 1216). Below Stillhouse Hollow Lake, the Lampasas River flows to its confluence with Salado Creek and the Leon River to form the Little River.

According to the 2002, 2004, 2006 and 2008 Texas Water Quality Inventory and 303(d) List, the Lampasas River above Stillhouse Hollow Lake is impaired by elevated bacteria concentrations and did not meet Texas Surface Water Quality Standards for contact recreation. However, the Lampasas River was not listed as impaired on the 2014 Integrated Report. A portion of the river was delisted on the 2010 Integrated Report because no additional data had been collected for assessment from 2000 until late 2009 and existing historical data no longer met TCEQ's criteria to be included in assessment.

Prior to the river's delistment, Texas A&M AgriLife Research and TSSWCB established the Lampasas River Watershed Partnership in November 2009 as part of TSSWCB project 07-11, *Lampasas River Watershed Assessment and Protection Project*. This project updated land use, modeled water quality, and developed a WPP to address the bacteria impairment. With technical assistance from Texas A&M AgriLife Research and other state and federal partners, the Steering Committee identified water quality issues that are of particular importance to the surrounding communities. The WPP identified responsible parties, implementation milestones and estimated financial costs for individual management measures and outreach and education activities. The plan also described the estimated load reductions expected from full implementation of all management measures.

TSSWCB project 12-09, *Coordinating Implementation of the Lampasas River Watershed Protection Plan* and project 14-07, *Continued Coordinating Implementation of the Lampasas River Watershed Protection Plan*, continue facilitation of the Lampasas River WPP. The WPP was accepted by EPA in May 2013 as being consistent with national guidance and was approved by the Steering Committee in September 2013 and may be found on the project webpage at <http://www.lampasasriver.org>. The timeline for full implementation of all the management measures in the Lampasas River WPP is 10 years.

In addition to the TSSWCB project identified above, several other programs are being implemented in the watershed. TSSWCB 12-06, *Statewide Delivery of Lone Star Healthy Streams Feral Hog Component and Providing Technical Assistance on Feral Hog Management in Priority Watersheds* provides resources to the stakeholders in the Lampasas River watershed in the form of a local feral hog specialist to assist landowners with feral hog control. TSSWCB project 14-06, *Implementing Agricultural Nonpoint*

Source Components of the Lampasas River Watershed Protection Plan, provides technical and financial assistance to landowners to develop and implement Water Quality Management Plans. TSSWCB project 13-09, *Surface Water Quality Monitoring to Support the Implementation of the Lampasas River Watershed Protection Plan* collected monthly water quality data at ten sites to be utilized in evaluating the effectiveness of BMPs in the watershed. Projects 13-09 and 16-06 concluded their sampling programs, and this project will provide continued monitoring as supported under project 19-54.

The stakeholders of the Lampasas River Watershed Partnership feel that maintaining a continuous monitoring program is crucial to the success of the WPP. To date, there have been seven completed or ongoing CWA 319(h) projects to assess, monitor or improve water quality through education or implementation in the watershed. This project will provide critical water quality data that will be used to measure the effectiveness of WPP implementation efforts and serve as a tool to quantitatively measure water quality restoration.

Section A6: PROJECT/TASK DESCRIPTION

This project will generate bacteria, conventional, flow, and field data of known and acceptable quality from surface water quality monitoring of ten main stem and tributary stations on the Lampasas River above Stillhouse Hollow Lake (1217), Reese Creek (1217F), Clear Creek (unclassified tributary to 1217), and Sulphur Creek (1217B). Two types of surface water quality monitoring will be conducted at these 10 stations: routine and biased flow. Figure A6.1 is a map of the monitoring locations in the Lampasas River watershed.

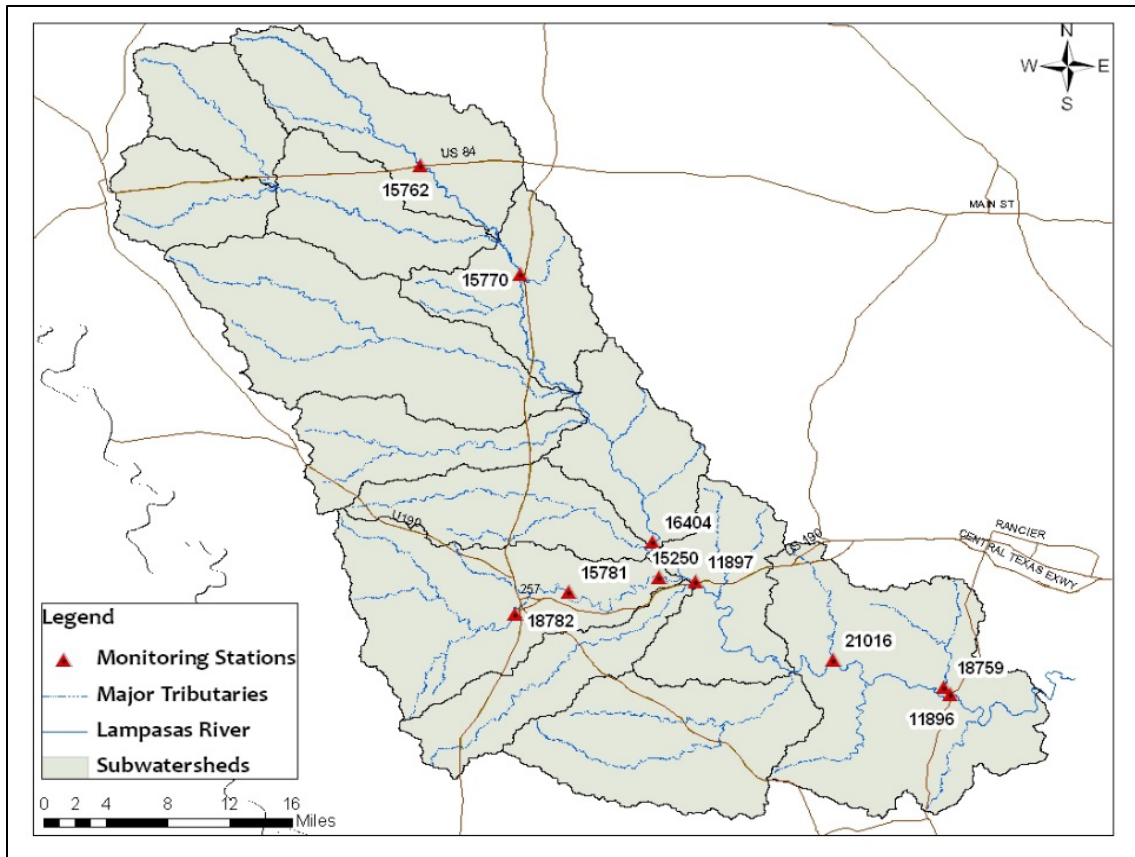

Figure A6.1 Map of Lampasas River Monitoring Locations

AgriLife will conduct work performed under this project associated with technical and financial supervision, preparation of status reports, and coordination with local stakeholders, data analysis and development of the final project report. AgriLife Research will host and facilitate meetings of the Partnership as appropriate in order to communicate project goals, activities and achievements, and movement towards water quality restoration.

Figure 1 Map of water quality monitoring stations recommended by the Lampasas River Watershed Partnership to evaluate the effectiveness of BMP implementation TIAER will conduct work as outlined under Task 3 of the work plan including surface water quality monitoring under ambient and biased flow conditions, laboratory analyses, and data preparation and submission to TCEQ SWQMIS. The project period extends through March 31, 2024. The sampling period extends for 28 months, with one ambient sampling event per month.

TIAER will conduct routine ambient monitoring at 10 sampling stations (5 mainstem and 5 tributary) on a monthly basis, for 28 months, collecting field and flow data, along with water quality samples that will be analyzed for conventional and bacteria parameter groups. As needed, TIAER will coordinate with TCEQ and BRA so as not to duplicate sampling efforts.

TIAER will also conduct biased flow monitoring 3 times at the same 10 stations once under wet weather conditions. The same types of data will be collected during biased flow monitoring as during routine monitoring (field, flow, conventional parameters, bacteria), with the exception of chlorophyll-a and pheophytin. Under high flow conditions, associated high TSS concentrations often makes filtration for the analysis of chlorophyll-a and pheophytin difficult; thus, these two parameters will not be included with biased flow monitoring. If a routine sampling event happens to capture wet weather conditions, an additional wet weather sample will not be collected that quarter. Spatial, seasonal and meteorological variation will be captured across the sampling period by the biased flow and routine monitoring.

TIAER will manage monitoring data in support of the Lampasas River WPP. TIAER will prepare monitoring data on a quarterly basis according to TCEQ SWQMIS formatting requirements and protocols. TIAER will provide all data submission documents to AgriLife for submission to TCEQ.

AgriLife will summarize the results and activities of this project for inclusion in the BRA's *Clean Rivers Program Basin Highlights Report* and Basin Summary Report. Additionally, AgriLife will develop a Final Report that summarizes activities completed and conclusions reached during the project and discusses the extent to which project goals and measures of success have been achieved. This Final Report will include summarizing water quality data collected including statistical and trend analysis to evaluate the effectiveness of BMPs implemented.

Table A6.1 presents project milestones. See Appendix A for sampling design and monitoring pertaining to this QAPP.

Table A6.1 Project Milestones

TASK	PROJECT MILESTONES	AGENCY	START*	END
1.4	Development of Final Report	AgriLife Research	M29	M41
2.1	Develop QAPP for review and approval by TSSWCB and EPA.	TIAER & AgriLife Research	M1	M6
2.2	Submit revisions to QAPP as necessary.	TIAER & AgriLife Research	M7	M41
3.1	Monitor 10 routine sites monthly, collecting field, conventional, flow and bacteria parameter groups.	TIAER	M6	M34
3.2	Conduct 3 biased flow monitoring at 10 sites, under wet conditions, collecting field, conventional (excluding chlorophyll-a and pheophytin), flow and bacteria parameter groups.	TIAER	M6	M34
3.3	Transfer monitoring data on a quarterly basis to TCEQ SWQMIS. Submit station location requests to TCEQ, if required. Submit data correction requests, if errors are discovered in reported data.	TIAER	M8	M37

* If the QAPP is approved earlier than Month 6, all other Start and End dates can also start and end earlier.

Section A7: QUALITY OBJECTIVES AND CRITERIA FOR DATA QUALITY

The purpose of the project's water quality monitoring is to support implementation of the Lampasas River WPP by collecting surface water data for use in evaluating the effectiveness of BMPs and in assessing water quality improvement. The water quality data and evaluations of water quality conditions will be communicated to the public and the Lampasas River Watershed Partnership to support adaptive management of the Lampasas River WPP and expand public knowledge on Lampasas River water quality data. All monitoring data will be submitted to TCEQ SWQMIS making routine data available for future water quality assessments of the Lampasas as addressed by the TCEQ as part of their biennial Integrated Report.

Routine and flow biased watershed monitoring will be conducted to characterize water quality under a range of flow regimes created by wet and dry periods, assess water quality with respect to effectiveness of implemented best management practices, and investigate areas of potential concern. Monitoring in the Lampasas River watershed will be performed to capture spatial, seasonal and meteorological data to provide snapshots of water quality under a variety of conditions.

The measurement performance specifications to support the project data collection objectives are specified in Table A7.1 for the 10 routine and biased flow stations. Only data collected for the project that have a valid TCEQ parameter code assigned in Table A.7.1 are submitted to SWQMIS.

Ambient Water Reporting Limits (AWRLs)

The AWRLs establish the reporting specification at or below which data for a parameter must be reported to be compared with freshwater screening criteria. The AWRLs specified in Table A7.1 are the program-defined reporting specifications for each analyte and yield data acceptable for TCEQ water quality assessment. The limit of quantitation (LOQ) is the minimum level, concentration, or quantity of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The following requirements must be met in order to report results to the TCEQ SWQMIS:

- The laboratory's LOQ for each analyte must be at or below the AWRL as a matter of routine practice
- The laboratory must demonstrate its ability to quantitate at its LOQ for each analyte by running an LOQ check sample for each batch of samples analyzed.

Laboratory measurement quality control requirements and acceptability criteria are provided in Section B5.

Table A7.1 Measurement Performance Specifications for Routine and Biased Flow Monitoring

- 1 Flow estimate as a parameter will be reported if conditions are unsafe for conducting direct flow measurements at a site.
- 2 Parameters for pools to be reported only if pooled conditions are sampled as outlined under the TCEQ Interim Guidance for Routine Surface Water Quality Monitoring During Extended Drought.
- 3 For method specific QC requirements, precision will be based on LCS and MS duplicate RPD results when the RPD for environmental sample duplicates is out of control and the value of the environmental sample and/or the environmental sample duplicate is less than five times the LOQ.
- 4 Chlorophyll-a and pheophytin will be analyzed only with routine monthly monitoring and not with samples solely representing biased flow samples related to storm events.
- 5 This value represents the maximum allowable difference between the logarithm of the sample result and the logarithm of the duplicate result.

Precision

Precision is the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. It is a measure of agreement among replicate measurements of the same property, under prescribed similar conditions, and is an indication of random error.

Laboratory precision is assessed by comparing replicate analyses of laboratory control samples in the sample matrix (e.g. deionized water, sand, commercially available tissue) or sample/duplicate pairs in the case of bacterial analysis. Precision results are compared against measurement performance specifications and used during evaluation of analytical performance. Program-defined measurement performance specifications for precision are defined in Table A7.1.

Bias

Bias is a statistical measurement of correctness and includes multiple components of systematic error. A measurement is considered unbiased when the value reported does not differ from the true value. Bias is determined through the analysis of laboratory control samples and LOQ check samples prepared with verified and known amounts of all target analytes in the sample matrix (e.g. deionized water) and by calculating percent recovery. Results are compared against measurement performance specifications and used during evaluation of analytical performance. Program-defined measurement performance specifications for laboratory control standards are specified in Table A7.1.

Representativeness

Site selection, the appropriate sampling regime, the sampling of all pertinent media according to TCEQ SWQM SOPs, and use only of approved analytical methods will assure that the measurement data represents the conditions at the monitoring sites. Representativeness will be measured with the completion of sample collection in accordance with the approved QAPP. The goal for meeting total representation of the waterbody will be tempered by the availability of stream and meteorological conditions during the project and the potential funding for complete representativeness.

Routine data collected for the project and submitted to TCEQ for water quality assessments are considered to be spatially and temporally representative of routine water

quality conditions. Water quality samples are collected on a monthly frequency and are separated by approximately even time intervals. Although data may come from samples collected during varying regimes of weather and flow, the data sets collected during routine monitoring will not be biased toward unusual conditions of flow, runoff, or season. The routine sites can double as targeted sites. Routine samples may satisfy the wet (biased high flow) weather conditions, depending on the flow conditions when samples are collected during the routine sampling that quarter.

Data collection for targeted sampling will be biased toward conditions influenced by storm events. Depending on meteorological conditions, monitoring for stormwater flows will occur once per season during a measurable rainfall event, if such conditions occur.

Comparability

Confidence in the comparability of routine data sets for this project and for water quality assessments is based on the commitment of project staff to use only approved sampling and analysis methods and QA/QC protocols in accordance with quality system requirements and as described in this QAPP and in TCEQ SWQM SOPs. Comparability is also guaranteed by reporting data in standard units, by using accepted rules for rounding figures, and by reporting data in the format required for submission to SWQMIS.

Completeness

The completeness of the data is basically a relationship of how much of the data is available for use compared to the total potential data. Ideally, 100% of the data should be available. However, the possibility of unavailable data due to accidents, insufficient sample volume, broken or lost samples, etc. is to be expected. Therefore, it will be a general goal of the project(s) that 90% data completion is achieved.

Section A8: SPECIAL TRAINING/CERTIFICATION

New monitoring staff personnel receive training in proper sampling and field data collection. Before independent sampling or data collection occurs, staff members demonstrate to the Field Operations Supervisor (or designee) their ability to properly calibrate field equipment and perform field sampling and data collection procedures. Field personnel training is documented and retained in the personnel file. The documentation is available during monitoring systems audits.

Contractors and subcontractors will ensure that laboratories analyzing samples under this QAPP meet the requirements contained in section 5.4.4 of the NELAC[®] standards (concerning Review of Requests, Tenders and Contracts).

Section A9: DOCUMENTS AND RECORDS

The documents and records that describe, specify, report, or certify activities are listed in Table A9.1. All records are kept for a minimum of five years after the end of the project.

Table A9.1 Project Documents and Records

Document/Record	Location	Retention	Format
QAPPs, amendments and appendices	TSSWCB/AgriLife	5 years	Paper/ Electronic
QAPP distribution documentation	AgriLife	5 years	Paper/ Electronic
QAPP commitment letters	AgriLife	5 years	Paper/ Electronic
Field notebooks or data sheets	TIAER	5 years	Paper/ Electronic
Field staff training records	TIAER	5 years	Paper/ Electronic
Field equipment calibration/maintenance logs	TIAER	5 years	Paper/ Electronic
Chain of custody records	TIAER	5 years	Paper/ Electronic
Field SOPs	TIAER	5 years	Paper/ Electronic
Laboratory QA Manuals	TIAER	5 years	Paper/ Electronic
Laboratory SOPs	TIAER	5 years	Paper/ Electronic
Laboratory data reports/results	TIAER	5 years	Paper/electronic
Laboratory staff training records	TIAER	5 years	Paper/ Electronic
Instrument printouts	TIAER	5 years	Paper/ Electronic
Laboratory equipment maintenance logs	TIAER	5 years	Paper/ Electronic
Laboratory calibration records	TIAER	5 years	Paper/ Electronic
Corrective Action Documentation	TIAER	5 years	Paper/ Electronic

All TIAER records, including notebooks and electronic files of technical staff, will be archived by TIAER for at least five years after the end of the project. Electronic data are backed up on individual computers and on the network server, which is backed up daily; data are also backed up to an external hard drive weekly. In the event of a catastrophic systems failure, the tapes can be used to restore the data. Data generated on the day of the failure may be lost, but can be reproduced from raw data in most cases.

The TSSWCB may elect to take possession of records at the conclusion of the specified retention period.

Laboratory Test Reports

Test reports from the laboratory will document the test results clearly and accurately. Reporting of the data will follow standard formats and protocols for TCEQ's SWQMIS database. If needed for alternate types of reporting by TSSWCB, requirements and procedures for reporting data are provided below.

- * title of report and unique identifiers on each page
- * name and address of the laboratory
- * name and address of the client
- * a clear identification of the sample(s) analyzed
- * date and time of sample collection
- * date and time of sample receipt by the laboratory
- * sample depth
- * identification of analytical method used
- * identification of samples not meeting QA requirements and reason (e.g., holding times exceeded)
- * sample results
- * units of measurement
- * sample matrix
- * dry weight or wet weight (as applicable)
- * clearly identified subcontract laboratory results (as applicable)
- * a name and title of person accepting responsibility for the report
- * project-specific quality control results to include field split results (as applicable); equipment, trip, and field blank results (as applicable); and LOQ confirmation (% recovery)
- * narrative information on QC failures or deviations from requirements that may affect the quality of results or is necessary for verification and validation of data
- * certification of NELAC[®] compliance on a result by result basis, where pertinent.

Electronic Data

Data will be submitted electronically from TIAER to the Lampasas River Watershed Coordinator at the Blackland Research & Extension Center for review in the Event/Result file format. A completed Data Summary (see example in Appendix D) and a TCEQ Validator Report will be included with each data submittal. The Lampasas River Watershed Coordinator will provide copies of the dataset to the TCEQ SWQMIS representative for inclusion in the TCEQ Surface Water Quality Monitoring Information System database.

Revisions and Amendments to the QAPP

Until the work described is completed, this QAPP shall be revised as necessary and reissued annually on the anniversary date, or revised and reissued within 120 days of significant changes, whichever is sooner. The last approved versions of QAPPs shall remain in effect until revised versions have been fully approved; the revision must be submitted to the TSSWCB and EPA Region 6 for approval no less than sixty (60) days before the last approved version has expired. If the entire QAPP is current, valid, and accurately reflects the project goals and the organization's policy, the annual re-issuance may be done by a certification that the plan is current. This will be accomplished by submitting a cover letter stating the status of the QAPP and a copy of new, signed approval pages for the QAPP to TSSWCB and EPA Region 6, sixty (60) days prior to the last approved version expiring.

Amendments to the QAPP may be necessary to address incorrectly documented information or to reflect changes in project organization, tasks, schedules, objectives, and methods; address deficiencies and nonconformance; improve operational efficiency; and/or accommodate unique or unanticipated circumstances. Requests for amendments will be directed from the AgriLife Project Manager to the TSSWCB Project Manager electronically. Amendments are effective immediately upon approval by the AgriLife Project Manager, TIAER Project Manager, TIAER Project QAO, the TSSWCB Project Manager, and the TSSWCB QAO and EPA Region 6 Project Officer. They will be incorporated into the QAPP by way of attachment and distributed to personnel on the distribution list by the AgriLife Project Manager. Amendments shall be reviewed, approved, and incorporated into a revised QAPP during the annual revision process.

Section B1: SAMPLING PROCESS DESIGN

The sample design was developed to support implementation of the Lampasas River WPP by collecting surface water data for use in evaluating the effectiveness of BMPs and assessing water quality improvement. The water quality data and evaluations of water quality conditions will be communicated to the public and the Lampasas River Watershed Partnership to support adaptive management of the Lampasas River WPP and expand public knowledge on Lampasas River water quality data. All monitoring data will be submitted to TCEQ SWQMIS, making routine data available for future water quality assessments of the Lampasas as addressed by the TCEQ as part of their biennial Integrated Report.

Ten routine monitoring sites have been selected to provide spatial distribution of data in the watershed (see Figure A6.1.). Monthly routine monitoring at each site includes conventional, bacterial and field parameter groups. Conventional parameters include total suspended solids, chlorophyll-a, pheophytin, total Kjeldahl nitrogen, nitrate+nitrite nitrogen and total phosphorus. Bacterial parameters include *E. coli*. Field parameters include flow, Secchi depth, pH, dissolved oxygen, water temperature and specific conductance. Analytical results will be used to assess water quality with respect to effectiveness of best management practices implemented.

There may be times, during dry weather conditions, when there is no water in the streams in the subwatersheds. Those visits will be documented but no water quality samples will be collected. During periods when water is not flowing, a flow severity of either No Flow (1) or Dry (6) will be recorded and reported. In addition, when pooled conditions exist, an Instantaneous Flow for parameter 00061 will be reported as 0. When the stream is dry, no record is reported for parameter 00061. If waters are pooled at a station, not flowing, and pools meet guidelines as outlined in the TCEQ *Interim Guidance for Routine Surface Water Quality Monitoring During Extended Drought*, water samples will be collected and analyzed as routine samples. Only under pooled conditions will the additional parameters of maximum pool width, maximum pool depth, pool length and % pool coverage in 500 meter reach be reported. Routine monitoring will be coordinated to complement any existing routine ambient monitoring conducted by TCEQ and BRA.

Biased flow monitoring will be conducted at the same ten sites in the Lampasas River and contributing subwatersheds. Biased sampling events will be conducted once per quarter during wet weather conditions, if wet weather conditions occur during the quarter. Streams are considered under wet weather conditions after a rainfall event that contributes runoff to the base flow of the stream. TIAER staff members check the <https://waterdata.usgs.gov/tx/nwis/current/?type=flow> website to determine whether USGS gages located at the sampling sites have risen. If the gage has risen by at least one foot, biased sampling is conducted unless another biased has occurred that quarter. If no biased events have occurred during the quarter and it is near the end of the quarter, a rise of at least half a foot will initiate biased sampling.

In case of lightning or flooding during wet weather conditions, the safety of the sampling crew will not be compromised. In the instance that a sampling site is inaccessible or unsafe to access due to weather conditions or flooding, “no sample due to inaccessibility” will be documented in the field notebook and a flow severity of Flood (4) will be reported. Flows may be estimated rather than directly measured if water levels are unsafe.

The same parameters as for routine monitoring will be evaluated with biased flow samples except for chlorophyll-a and pheophytin. Chlorophyll-a and pheophytin will not be measured with biased flow samples due to filtration issues associated with increased turbidity with elevated flows.

See Appendix A for sampling process design information and monitoring tables associated with data collected under this QAPP.

Section B2: SAMPLING METHODS

Field Sampling Procedures

Field sample and data collection will be conducted according to procedures documented in the most current version of *TCEQ Surface Water Quality Monitoring Procedures, Volume 1*. Specifications outlined in Table B2.1 reflect additional requirements for sampling for the project and/or provide additional clarification.

Table B2.1 Sample Storage, Preservation and Handling Requirements

Parameter	Matrix	Container	Preservation*	Sample Volume	Holding Time
TSS	Water	Plastic or glass	Cool, >0-≤6°C	1 L	7 days
NO ₂ +NO ₃ -N	Water	Plastic or glass	Cool, >0-≤6°C; H ₂ SO ₄ to pH < 2	1 L	28 days
TKN	Water	Plastic or glass	Cool, >0-≤6°C, H ₂ SO ₄ to pH < 2	1 L	28 days
Total Phosphorus	Water	Plastic or glass	Cool, >0-≤6°C; H ₂ SO ₄ to pH < 2	1 L	28 days
Chlorophyll-a and Pheophytin	Water	Amber plastic or glass	Dark, Cool, >0-≤6°C	1 L	Filter within 48 hours; 28 days at 0°C
<i>E. coli</i>	Water	Sterile plastic pretreated with sodium thiosulfate	Cool, >0-≤6°C	250 mL	8 hours

*Preservation begins within 15 minutes of sample collection.

Sample Containers

Sterile bacteria containers and filters for field filtering are used only once before being disposed. The remainder of the sample containers are reusable plastic bottles. Reusable containers are thoroughly cleaned upon receipt before initial use and after each use. Reusable containers are cleaned by washing them in hot, soapy (non-phosphate) water, then rinsed first in warm tap water, then with 1 N hot HCL, and finally rinsed at least three times in type II ASTM water, which has conductivity of less than 1 microsiemen per centimeter. Containers are then placed on a rack to dry. The TIAER QAM-I-116 “Preparation of Labware” contains specific steps used for cleaning sampling containers and equipment used in field operations and is available for review upon request.

TIAER's tracking system to detect contamination resulting from the washing procedure is based on method blank numbers, which are date stamped numbers assigned at the time of analysis. One method blank is evaluated with each preparation batch of 20 samples or less by analyzing deionized water in the same manner as environmental samples. Each lot of sterile, disposable bacteria containers is also tested for sterility as part of the bacterial

analyses QC. If any measured concentration is greater than the LOQ, the method blank fails and is reanalyzed. If the method blank fails a second time, the data are flagged for review by the Project Manager and QAO. Sources of contamination are investigated and remediated, if found. Corrective action documentation is maintained for all method blanks that exceed the LOQ.

Processes to Prevent Contamination

Procedures in the *TCEQ Surface Water Quality Monitoring Procedures* outline the necessary steps to prevent contamination of samples, including direct collection into sample containers, when possible. Field QC samples (identified in Section B5) are collected to verify that contamination has not occurred.

Documentation of Field Sampling Activities

Field sampling activities are documented on field data sheets (see Appendix B). The following will be recorded for all visits:

- station ID
- sampling date
- sampling time
- sampling depth
- sample collector's name/signature
- values for all field parameters, including flow and flow severity
- detailed observational data, where appropriate, including:
 - water appearance
 - weather
 - biological activity
 - unusual odors
 - pertinent observations related to water quality or stream uses (i.e., exceptionally poor water quality conditions; stream uses such as swimming, boating, fishing, irrigation pumps)
 - watershed or instream activities (i.e., bridge construction, livestock watering upstream)
- missing parameters (i.e., when a scheduled parameter or group of parameters is not collected)

Recording Data

For the purposes of this section and subsequent sections, all field and laboratory personnel follow the basic rules for recording information as documented below:

- Legible writing in indelible ink with no modifications, write-overs or cross-outs;
- Correction of errors with a single line followed by an initial and date;
- Close-out on incomplete pages with an initialed and dated diagonal line.

Sampling Method Requirements or Sample Processing Design Deficiencies and Corrective Action

Examples of sampling method requirements or sample design deficiencies include but are not limited to such things as inadequate sample volume due to spillage or container leaks, failure to preserve samples appropriately, contamination of a sample bottle during collection, storage temperature and holding time exceedance, sampling at the wrong site, etc. Any deviations from the QAPP and appropriate sampling procedures may invalidate resulting data and may require corrective action. Corrective action may include for samples to be discarded and re-collected. It is the responsibility of the TIAER Project Manager, in consultation with the TIAER Project QAO, to ensure that the actions and resolutions to problems are documented by completion of a corrective action report (CAR) and that records are maintained in accordance with this QAPP. In addition, these actions and resolutions will be conveyed to the AgriLife Project Manager who will inform the TSSWCB Project Manager in writing in the project progress reports.

The definition of and process for handling deficiencies and corrective action are defined in Section C1.

Section B3: SAMPLE HANDLING AND CUSTODY

Sample Tracking

Proper sample handling and custody procedures ensure the custody and integrity of samples beginning at the time of sampling and continuing through transport, sample receipt, preparation, and analysis.

A sample is in custody if it is in actual physical possession or in a secured area that is restricted to authorized personnel. The Chain of Custody (COC) form is a record that documents the possession of the samples from the time of collection to receipt in the laboratory. The following information concerning the sample is recorded on the COC form (See Appendix C).

- Date and time of collection
- Site identification
- Sample matrix, indicated by the test group code
- Number of containers and container type ID designation
- Preservative used or if the sample was filtered, indicated by test group code
- Analyses required, indicated by the test group code
- Name of collector
- Custody transfer signatures and dates and time of transfer
- Name of laboratory accepting the sample

Sample Labeling

Samples from the field are labeled on the container with an indelible marker. Label information includes:

- Site identification
- Date of sampling
- Time of sampling
- Preservative added, as indicated by container type

Sample Handling

After collection of samples is complete, sample containers are immediately stored in an ice chest for transport to the TIAER laboratory. Ice chests remain in the possession of the field technician or in the locked vehicle until delivered to the lab. After submission to the TIAER laboratory, the samples remain in the log-in room until log-in is complete, then they are stored in the refrigeration unit or given to an analyst for immediate analysis. Only authorized laboratory personnel handle samples received by the laboratory.

Sample Tracking Procedure Deficiencies and Corrective Action

All deficiencies associated with COC procedures and described in this QAPP are reported to the TIAER Project Manager. These include such items as delays in transfer resulting in holding time violations; violations of sample preservation requirements; incomplete documentation, including signatures; possible tampering of samples; and broken or spilled samples. The TIAER Project Manager, in consultation with the AgriLife PM and TIAER Project QAO, will determine if the procedural violation may have compromised the validity of resulting data. Any failures that have reasonable potential to compromise data quality will invalidate data, and the sampling event should be repeated, if feasible. The resolution of the situation will be reported to the TSSWCB Project Manager in the project progress report. CARs will be prepared by the TIAER personnel and summarized by the TIAER PM for submittal to the AgriLife Project Manager for inclusion with project progress report.

The definition of and process for handling deficiencies and corrective action are defined in Section C1.

Section B4: ANALYTICAL METHODS

The analytical methods, associated matrices, and performing laboratories are listed in Table A7.1 of Section A7. The procedures for laboratory analysis shall be in accordance with the most recently published edition of Standard Methods for the Examination of Water and Wastewater, the latest version of the TCEQ Surface Water Quality Monitoring Procedures, 40 CFR Part 136, or other reliable procedures acceptable to the TSSWCB.

Laboratories collecting data under this QAPP are compliant with the NELAC[®] standards, at a minimum. Copies of laboratory SOPs are available for review by the TSSWCB.

Standards Traceability

All standards used in the field and laboratory are traceable to certified reference materials. Standards preparation is fully documented and maintained in a standards log book. Each documentation includes information concerning the standard identification, starting materials, including concentration, amount used and lot number; date prepared, expiration date and preparer's initials/signature. Reagent bottles are labeled to trace the reagent back to preparation. Table A7.1, Measurement Performance Specifications, lists the methods to be used for field and laboratory analyses.

Deficiencies, Nonconformances and Corrective Action Related to Quality Control

Deficiencies are defined as unauthorized deviations from procedures documented in the QAPP or other applicable documents. Nonconformances are deficiencies which affect quantity and/or quality and render the data unacceptable or indeterminate. Deficiencies related to field and laboratory measurement systems include, but are not limited to, instrument malfunctions, blank contamination, and QC sample failures.

Deficiencies are documented in logbooks, field data sheets, etc. by field or laboratory staff and reported to the pertinent field or laboratory supervisor who will notify the TIAER Project Manager. A Corrective Action Report to document the deficiency is written for each deficiency.

The TIAER Project Manager, in consultation with the AgriLife PM and TIAER Project QAO (and other affected individuals/organizations), will determine whether the deficiency could affect data quality. If it is determined the item in question does not affect data quality and therefore is not a valid nonconformance, the CAR will be completed accordingly and closed. If it is determined a nonconformance does exist, the TIAER Project Manager, in consultation with the AgriLife PM and TIAER Project QAO, will determine the disposition of the nonconforming activity or item and necessary corrective action(s); results will be documented in the CAR (see Appendix E).

The definition of and process for handling deficiencies and corrective action are defined in Section C1.

The TCEQ has determined that analyses associated with the qualifier codes (e.g. “holding time exceedance”, “sample received unpreserved”, “estimated value”) may have unacceptable measurement uncertainty associated with them. Therefore, data with these types of problems shall be clearly qualified when the dataset is submitted to the TCEQ. Additionally, any data collected or analyzed by means other than those stated in the QAPP, or data suspect for any reason shall be appropriately qualified (see SWQM DMRG July 2019 or most recent version for data qualifiers). TCEQ will review the data and load approved data into SWQMIS.

Section B5: QUALITY CONTROL

Laboratory Measurement Quality Control Requirements and Acceptability Criteria

Batch - A batch is defined as environmental samples that are prepared and/or analyzed together with the same process and personnel, using the same lot(s) of reagents. A **preparation batch** is composed of one to 20 environmental samples of the same NELAP-defined matrix, meeting the above mentioned criteria and with a maximum time between the start of processing of the first and last sample in the batch to be 25 hours. An **analytical batch** is composed of prepared environmental samples (extract, digestates or concentrates) which are analyzed together as a group. An analytical batch can include prepared samples originating from various environmental matrices and can exceed 20 samples.

Method Specific QC requirements – QC samples, other than those specified in this section (i.e., sample duplicates, surrogates, internal standards, continuing calibration samples, interference check samples, positive control, negative control, and media blank), are analyzed as specified in the methods. The requirements for these samples, their acceptance criteria or instructions for establishing criteria, and corrective actions are method-specific.

Detailed laboratory QC requirements and corrective action procedures are contained within the individual laboratory SOPs. The minimum requirements to which all participants abide by are stated below.

Limit of Quantitation (LOQ) – The laboratory will analyze a calibration standard (if applicable) at the LOQ on each day calibrations are performed. In addition, an LOQ check sample will be analyzed with each analytical batch. Calibration results, including the standard at the LOQ listed in Table A7.1, will meet the calibration requirements of the analytical method or corrective action will be implemented.

LOQ Check Sample – An LOQ check sample consists of a sample matrix (e.g., deionized water, sand, commercially available tissue) free from the analytes of interest spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes. The LOQ check sample is carried through the complete preparation and analytical process and run at a rate of one per analytical batch. It is used to establish intra-laboratory bias to assess the performance of the measurement system at the lower limits of analysis.

The LOQ check sample is spiked into the sample matrix at a level less than or near the LOQ for each analyte in each analytical batch of samples analyzed. If it is determined that sample results exceeded the high range of the calibration curve, samples should be diluted or run on another curve. For samples run on batches with calibration curves that

do not include the LOQ, a check sample will be run at the low end of the calibration curve.

The percent recovery of the LOQ check sample is calculated using the following equation in which %R is percent recovery, SR is the sample result, and SA is the reference concentration for the check sample:

$$\%R = SR/SA * 100$$

Measurement performance specifications are used to determine the acceptability of LOQ check sample analyses as specified in Table A7.1.

Laboratory Control Sample (LCS) - A LCS consists of a sample matrix (e.g. deionized water) free from the analytes of interest spiked with verified known amounts of analyte. It is used to establish intra-laboratory bias to assess the performance of the measurement system. The LCS is spiked into the sample matrix at a level less than or equal to the mid-point of the calibration curve for each analyte. In cases of test methods with very long lists of analytes, LCSs are prepared with all the target analytes and not just a representative number. The LCS is carried through the complete preparation and analytical process and run at a rate of one per batch.

Results of LCSs are calculated by percent recovery (%R), which is defined as 100 times the measured concentration, divided by the true concentration of the spiked sample. The following formula is used to calculate percent recovery, where %R is percent recovery; SR is the measured result; and SA is the true result:

$$\%R = SR/SA * 100$$

Measurement performance specifications are used to determine the acceptability of LCS analyses as specified in Table A7.1.

Laboratory Duplicates - A laboratory duplicate is an aliquot taken from the same container as an original sample under laboratory conditions and processed and analyzed independently. A laboratory control sample duplicate (LCSD) is prepared in the laboratory by splitting aliquots of an LCS. Both samples are carried through the entire preparation and analytical process. LCSDs are used to assess precision and are performed at a rate of one per batch.

For most parameters, except bacteria, precision is evaluated using the relative percent difference (RPD) between duplicate LCS results as defined by 100 times the difference (range) of each duplicate set, divided by the average value (mean) of the set. For duplicate results, X1 and X2, the RPD is calculated from the following equation:

$$RPD = |(X1 - X2)/\{(X1+X2)/2\} * 100|$$

For bacteriological parameters, precision is evaluated using the results from laboratory sample duplicates. Bacteriological duplicate are collected on a 10% frequency (or once per sampling run, whichever is more frequent). These duplicates will be collected in sufficient volume (200 mL or more) for analysis of the sample and its laboratory duplicate from the same container.

The base-10 logarithms of the results from the original sample and its duplicate are calculated. The absolute value of the difference between the two logarithms will be compared to the precision criterion in Table A7.1. If the difference in logarithms is greater than the precision criterion, the data are not acceptable for use under this project and will not be reported to TSSWCB. Results from all samples associated with that failed duplicate (usually a maximum of 10 samples) will be considered to have excessive analytical variability and will be qualified as not meeting project QC requirements.

The precision criterion in Table A7.1 for bacteriological duplicates applies to only samples with concentrations > 10 MPN/100 mL.

Matrix spike (MS) –Matrix spikes are prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. The components to be spiked shall be specified by the mandated analytical method. The results from matrix spikes are primarily designed to assess the validity of analytical results in a given matrix, and are expressed as percent recovery (%R).

Matrix spikes indicate the effect of the sample on the precision and accuracy of the results generated using the selected method. The frequency of matrix spikes is specified by the analytical method, or a minimum of one per preparation batch, whichever is greater. To the extent possible, matrix spikes prepared and analyzed over the course of the project should be performed on samples from different sites.

The percent recovery of the matrix spike is calculated using the following equation, where %R is percent recovery, SSR is the concentration measured in the matrix spike, SR is the concentration in the unspiked sample and SA is the concentration of analyte that was added:

$$\%R = (SSR - SR)/SA * 100$$

Matrix spike recoveries are compared to the acceptance criteria published in the mandated test method. Where there are no established criteria, the laboratory shall determine the internal criteria and document the method used to establish the limits. If the matrix spike results are outside laboratory-established criteria, there will be a review of all other associated quality control data in that batch. If all of quality control data in the associated batch passes, it will be the decision of the TIAER PM in consultation with the

TIAER Project QAO to either report the data for the analyte that failed in the parent sample to TCEQ SWQMIS or to determine that the result from the parent sample associated with that failed matrix spike is considered to have excessive analytical variability and does not meet project QC requirements. Depending on the similarities in composition of the samples in the batch, TIAER and AgriLife may consider excluding all of the results in the batch related to the analyte that failed recovery.

Method blank – A method blank is a sample of matrix similar to the batch of associated samples (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as the samples through all steps of the analytical procedures, and in which no target analytes or interferences are present at concentrations that impact the analytical results for sample analyses. The method blanks are performed at a rate of once per preparation batch. The method blank is used to document contamination from the analytical process. The analysis of method blanks should yield values less than the LOQ. For very high-level analyses, the blank value should be less than 5% of the lowest value of the batch, or corrective action will be implemented. Samples associated with a contaminated blank shall be evaluated as to the best corrective action for the samples (e.g., reprocessing or data qualifying codes). In all cases the corrective action shall be documented.

The method blank shall be analyzed at a minimum of one per preparation batch. In those instances for which no separate preparation method is used (example: volatiles in water) the batch shall be defined as environmental samples that are analyzed together with the same method and personnel, using the same lots of reagents, not to exceed the analysis of 20 environmental samples.

Deficiencies, Nonconformances and Corrective Action Related to Quality Control

Deficiencies are defined as unauthorized deviations from procedures documented in the QAPP or other applicable documents. Nonconformances are deficiencies that affect data quantity and/or quality and render the data unacceptable or indeterminate. Deficiencies related to QC include but are not limited to field and laboratory QC sample failures.

Deficiencies are documented in logbooks, field data sheets, etc., by field or laboratory staff who will initiate a CAR to document the deficiency. The CAR is reviewed by the appropriate field or laboratory supervisor who will forward it to the TIAER Project QAO, who will review the CAR, and notify the TIAER Project Manager, if appropriate.

The TIAER Project Manager, in consultation with TIAER Project QAO (and other affected individuals/organizations), will determine if the deficiency constitutes a nonconformance. If it is determined the activity or item in question does not affect data quality and therefore is not a valid nonconformance, the CAR will be completed accordingly and the CAR closed. If it is determined a nonconformance does exist, the TIAER Project Manager in consultation with the TIAER Project QAO will determine the

disposition of the nonconforming activity or item and necessary corrective action(s); results will be documented by the TIAER QAO by completion of a CAR (see Appendix E).

CARs document: root cause(s); impact(s); specific corrective action(s) to address the deficiency; action(s) to prevent recurrence; individual(s) responsible for each action; the timetable for completion of each action; and, the means by which completion of each corrective action will be documented. CARs will be included with quarterly progress reports. In addition, significant conditions (i.e., situations which, if uncorrected, could have a serious effect on safety or on the validity or integrity of data) will be reported to AgriLife and TSSWCB both verbally and in writing.

Section B6: INSTRUMENT/EQUIPMENT TESTING, INSPECTION AND MAINTENANCE

All sampling equipment testing and maintenance requirements are detailed in the *TCEQ Surface Water Quality Monitoring Procedures, Volume 1*. Sampling equipment is inspected and tested upon receipt and is assured appropriate for use. Equipment records are kept on all field equipment and a supply of critical spare parts is maintained.

All laboratory tools, gauges, instrument, and equipment testing and maintenance requirements are contained within laboratory SOPs.

Section B7: INSTRUMENT CALIBRATION AND FREQUENCY

Field equipment calibration requirements are contained in the *TCEQ Surface Water Quality Monitoring Procedures, Volume 1*. Post-calibration error limits and the disposition resulting from error are adhered to. Data not meeting post-error limit requirements invalidate associated data collected subsequent to the pre-calibration and are not submitted to the TCEQ SWQMIS.

Detailed laboratory calibrations are contained within the TIAER Laboratory SOPs.

Section B8: INSPECTION/ACCEPTANCE OF SUPPLIES AND CONSUMABLES

All sampling equipment testing and maintenance requirements are detailed in the most recent version of *TCEQ Surface Water Quality Monitoring Procedures, Volume 1*. Sampling equipment is inspected and tested upon receipt and is assured appropriate for use. Equipment records are kept on all field equipment and a supply of critical spare parts is maintained.

All laboratory tools, gauges, instrument, and equipment testing and maintenance requirements are contained within laboratory SOPs.

Section B9: NON-DIRECT MEASUREMENTS

Flow data from the United States Geological Survey (USGS) Station 08103800, Lampasas River near Kempner, Texas, is collocated with monitoring station 11897. Flow data from the United States Geological Survey (USGS) Station 08103940, Lampasas River at Ding Dong, Texas, is collocated with monitoring station 11896. Flow data from these USGS stations may be used for this project if TIAER is unable to collect direct flow measurement. Data from these stations may also be used by AgriLife in providing a historical perspective of longer-term flow conditions along the Lampasas River. TIAER project data submissions to SWQMIS will include only the flow data (parameter code 00061) and all other data collected directly by TIAER.

For evaluating trends, historical data from SWQMIS will be included in the statistical analyses as well as samples collected during the study period by the Brazos River Authority and TCEQ under the Clean Rivers Program.

Section B10: DATA MANAGEMENT

Data Management Process

Data Dictionary - Terminology and field descriptions are included in the *SWQM Data Management Reference Guide*, July 2019 or most recent version. The following table contains the codes used by TIAER when submitting data under this QAPP. The parameters associated with each sample and the sampling frequency by station are presented in Appendix A.

Table B10.1 Monitoring Type and Entity Codes

Sample Description	Tag Prefix	Monitoring Type	Submitting Entity	Collecting Entity
Routine Lampasas River mainstem or tributary grab sample (flowing, pooled, or dry)	<i>TX</i>	<i>RT</i>	<i>TX</i>	<i>TA</i>
Biased flow, wet-weather sample collected manually	<i>TX</i>	<i>BFBA</i>	<i>TX</i>	<i>TA</i>

TA Texas Institute for Applied Environmental Research

TX Texas State Soil and Water Conservation Board

RT Monitoring type code for routine monitoring scheduled in advance without intentionally trying to target any certain environmental condition; samples are collected regardless of the conditions encountered

BFBA Biased Flow- Monitoring targeted towards biased flow or runoff event and for determining effectiveness of Best Management Practices (BMPs)

TIAER Data Management Process

Field technicians and laboratory personnel follow protocols that ensure data collected for this project maintain their integrity and usefulness. Field data collected at the time of the sampling event are logged by the field technician, along with notes on sampling conditions in field logs or on field data sheets. The field log/sheet is the responsibility of the field technician. The samples, accompanied by a COC, are submitted to the laboratory where a TIAER Laboratory staff member reviews the COC to verify that it is filled out correctly and completely, and matches the submitted samples. The log-in staff member assigns a unique sample number to each sample, which is then recorded on the COC and the sample container. The log-in staff member logs the sample into the TIAER database. Laboratory analysts take receipt of the sample, begin sample prep or analysis and transfer samples into the refrigerator for storage. Examples of the field data sheets and COC used can be found in Appendices B and C.

Data generated by lab technicians are logged permanently on analysis bench sheets. The data are reviewed by the analyst prior to entering the data into the TIAER database. In the review, the analyst verifies that the sample data include date and time of analysis, documentation of dilutions and correction factors, and documentation of instrument calibrations, standard curves and control standards. The analysts also verify use of correct calculations and that data meet data quality objectives. A second review by another lab analyst/technician validates that the data meets the data quality objectives and that the data includes documentation of instrument calibrations, standard curves and control standards. After this review the lab analyst/technician inputs the data and quality control information into the Lab Samples Database for report generation and data storage.

The TIAER Laboratory Manager reviews the data after all analyses are complete. The analysis logs are reviewed to ensure that all necessary information is included and that the data quality objectives have been met. If the TIAER Laboratory Manager or Laboratory QAO suspect there has been an error or notes missing information, the data and records are reviewed to determine the need for correction. After review for reasonableness the data is cross-checked to the analysis logs by the TIAER Laboratory Manager. If errors are found, those errors are corrected in the TIAER database and are logged in a data correction log. After the review by the TIAER laboratory staff is complete, the Laboratory Manager marks the data as Approved in the database.

If at any time errors are identified, a CAR is written to document the situation. The TIAER Project Manager and Project Data Manager are responsible for ensuring that any data anomalies are reported in data submissions to TCEQ SWQMIS.

The following flow diagram outlines the path of TIAER data generated in the field:

Field data collected → Field data sheets → Initial data transferred to TIAER water quality database → Quality control review by TIAER Monitoring Staff member → Data reviewed by TIAER Project QAO and TIAER Project Manager → ASCII file format created → Blackland → AgriLife

The following flow diagram outlines the path of TIAER data generated in the laboratory:

Lab analysis → Initial data transferred to TIAER water quality database → Quality control review by TIAER Laboratory Manager and Lab QAO, including check for reasonableness and verification to analysis logs → Data reviewed by TIAER Project QAO and TIAER Project Manager → ASCII file format created → Blackland → AgriLife

After both Blackland and AgriLife have reviewed and approved the dataset, which includes an Excel file with data in spreadsheet format, as well as the Event file, Results file, and Data Summary, the TIAER Project Data Manager will create submit the files to TCEQ's SWQMIS Test Environment, which will evaluate the data values and formats, and, after any errors have been addressed, will generate a

Validator Report. The four documents will be sent to the Blacklands Project Manager, who will submit the project data to TCEQ to be entered into the SWQMIS database.

Data Errors and Loss

To minimize the potential for data loss, TIAER databases are backed up routinely and copies of the files are stored in a secure site on a weekly basis. If the laboratory database or network server fails, the back-up files can be accessed to restore operation or replace corrupted files.

Record Keeping and Data Storage

After field data are collected and recorded on field data sheets, the data sheets are filed for review and reference. These files are kept in paper and electronic form for a minimum of five years after the end of the project.

The data produced during each analysis is recorded on analysis logs. The information contained in the bench sheets include all quality control data associated with each day's or batch's analysis. The data on the logs are transferred to the laboratory database for report generation. The bench sheets are kept in electronic form for a minimum of five years after the end of the project.

The TIAER water quality database is housed on TIAER computers and is backed up on the network server nightly. The TIAER back-up copy of the network server files is stored in a secure location. The TIAER network administrator is responsible for the servers and back up generation.

Data Handling, Hardware, and Software Requirements

The laboratory database is housed on a TIAER server and backed up each evening. The systems run on Windows operating systems and any additional software needed for word processing, spreadsheet or presentations uses Microsoft Office Suite Professional Plus 2013 or later.

Information Resource Management Requirements

Data will be managed in accordance with the TCEQ *Surface Water Quality Monitoring Data Management Reference Guide*, and applicable TIAER information resource management policies.

The stations to be monitored for this project are existing TCEQ stations and will not require further geospatial data processing. However, in the event it becomes necessary to monitor new stations for this project, Global Positioning System (GPS) equipment may be used as a component of the information required by the Station Location (SLOC)

request process for creating the certified positional data that will ultimately be entered into the TCEQ's SWQMIS database. Positional data obtained by TIAER staff members using a Global Positioning System will follow the TCEQ's OPP 8.11 and 8.12 policy regarding the collection and management of positional data. All positional data to be entered into SWQMIS will be collected by a GPS certified individual with an agency approved GPS device to ensure that the agency receives reliable and accurate positional data. Certification can be obtained in any of three ways: completing a TCEQ training class, completing a suitable training class offered by an outside vendor, or by providing documentation of sufficient GPS expertise and experience.

In lieu of entering coordinates collected with a Global Positioning System, positional data may be acquired using a Geographical Information System (GIS) and verified with photo interpolation using a certified source, such as USGS Digital Ortho Quarter-Quadrangles (DOQQs), Google Earth or Google Maps. The verified coordinates and map interface can then be used to develop a new station location.

Section C1: ASSESSMENTS AND RESPONSE ACTIONS

The following table presents the types of assessments and response actions for data collection activities applicable to the QAPP.

Table C1.1 Assessments and Response Requirements

Assessment Activity	Approximate Schedule	Responsible Party	Scope	Response Requirements
Status Monitoring Oversight, etc.	Continuous	AgriLife and TIAER	Monitoring of the project status and records to ensure requirements are being fulfilled	Report to TSSWCB in Quarterly Report
Monitoring Systems Audit of TIAER	Dates to be determined by TSSWCB	TSSWCB QAO	Field sampling, handling and measurement; facility review; and data management as they relate to the project	30 days to respond in writing to the TSSWCB to address corrective actions
Laboratory Inspection	Dates to be determined by TSSWCB	TSSWCB QAO	Analytical and quality control procedures employed at the TIAER laboratory and the contracted laboratories	30 days to respond in writing to the TSSWCB to address corrective actions

Corrective Action

The TIAER Project Manager, Project QAO, and Laboratory Manager are responsible for implementing and tracking corrective action resulting from audit findings outlined in the audit report. Records of audit findings and corrective actions are maintained by both the TSSWCB and the TIAER Project Managers. Audit reports and corrective action documentation will be submitted to the TSSWCB via AgriLife with the Quarterly Report.

If audit findings and corrective actions cannot be resolved, then the authority and responsibility for terminating work are specified in the agreements in contracts between participating organizations.

Section C2: REPORTS TO MANAGEMENT

Reports to TIAER Project Management

As part of TIAER's overall data review procedure, the TIAER Laboratory Manager reviews all laboratory QC data results prior to approving the data for use in reports or submission to SWQMIS. Any QC deficiencies are documented by a corrective action report (CAR), which is linked in the database to project samples associated with the quality excursion. Any problems associated with sample collection, handling, log-in, or other situation are also documented with CARs. Pertinent supervisors, QAOs, and the Project Manager all review the CARs and provide input and evaluation as necessary prior to data being approved for use or submission. Project status, assessments and significant QA issues will be dealt with by the TIAER Project Manager who will determine whether it will be included in reports to AgriLife and TSSWCB Project Management.

Reports to TSSWCB Project Management

All reports detailed in this section are contract deliverables and are transferred to the TSSWCB from AgriLife in accordance with contract requirements.

Quarterly Report - Summarizes AgriLife and TIAER activities for each task; reports monitoring status, problems, delays, and corrective actions; and outlines the status of each task's deliverables.

Monitoring Systems Audit Report and Response - Following any audit performed by the TSSWCB, a report of findings, recommendations and response is included in the quarterly progress report sent to TSSWCB via AgriLife.

Final Report - Summarizes activities completed and conclusions reached during the project and discusses the extent to which project goals and measures of success have been achieved including summary water quality data collected during the project and statistical and trend analysis to evaluate the effectiveness of BMPs implemented.

Section D1: DATA REVIEW, VERIFICATION, AND VALIDATION

For the purposes of this document, the term verification refers to the data review processes used to determine data completeness, correctness, and compliance with technical specifications contained in applicable documents (i.e., QAPPs, SOPs, analytical methods). Validation refers to a specific review process that extends the evaluation of a data set beyond method and procedural compliance (i.e., data verification) to determine the quality of a data set specific to its intended use.

All field and laboratory will be reviewed and verified for integrity, completeness, reasonableness, and conformance to project requirements, and then validated against the project objectives and measurement performance specifications listed in Table A7.1. Only those data supported by appropriate quality control data and meet the measurement performance specifications defined for this project will be considered acceptable and will be reported to TCEQ SWQMIS. Any failures in data that occur during sample collection or laboratory analysis or failures noted during data review, verification, and validation procedure will be noted in the sample Comment field of the Event file submitted to TCEQ.

Section D2: VERIFICATION AND VALIDATION METHODS

All field and laboratory data will be reviewed, verified and validated to ensure they conform to project specifications and meet the conditions of end use as described in Section A7 of this document.

Data review, verification, and validation will be performed using self-assessments and peer and management review as appropriate to the project task. The data review tasks to be performed by field and laboratory staff are listed in the first two sections of Table D.2.1, respectively. Potential errors are identified by examination of documentation and by manual examination of corollary or unreasonable data. If a question arises or an error is identified, the manager of the task responsible for generating the data is contacted to resolve the issue. Issues that can be corrected are corrected and documented. If an issue cannot be corrected, the task manager consults with higher level project management to establish the appropriate course of action, or the data associated with the issue are rejected. Field and laboratory reviews, verifications, and validations are documented.

After the field and laboratory data are reviewed, another level of review is performed after the data are combined into a data set. This review step as specified in Table D.2.1 is performed by the TIAER Project QAO, then by the TIAER Project Manager. Data review, verification, and validation tasks to be performed on the data set include, but are not limited to, the confirmation of laboratory and field data review, evaluation of field QC results, additional evaluation of anomalies and outliers, analysis of sampling and analytical gaps, and confirmation that all parameters and sampling sites are included in the QAPP.

Another element of the data validation process is consideration of any findings identified during the monitoring systems audit conducted by the TSSWCB QAO. Any issues requiring corrective action must be addressed, and the potential impact of these issues on previously collected data will be assessed.

After the data are reviewed and documented, the TIAER Project Manager validates that the data meet the data quality objectives of the project and are suitable for reporting to TCEQ SWQMIS.

If any requirements or specifications of this project are not met, based on any part of the data review, the responsible party shall document the nonconforming activities with a CAR, which will be reviewed by the TIAER Project Manager prior to submission of the data. This information is communicated to the TSSWCB and AgriLife by TIAER. Depending on the nonconformance, affected data will be flagged or not transmitted to TCEQ SWQMIS.

Table D2.1: Data Review Tasks

Field Data Review	Responsibility
Field data reviewed for conformance with data collection, sample handling and chain of custody, analytical and QC requirements	TIAER Water Quality Field Technicians and Project QAO
Post-calibrations checked to ensure compliance with error limits	TIAER Water Quality Field Specialist
Field data calculated, reduced, and transcribed correctly	TIAER Water Quality Field Technicians and Project QAO
Laboratory Data Review	Responsibility
Laboratory data reviewed for conformance with data collection, sample handling and chain of custody, analytical and QC requirements to include documentation, holding times, sample receipt, sample preparation, sample analysis, project and program QC results, and reporting	TIAER Project QAO and TIAER Laboratory QAO
Laboratory data calculated, reduced, and transcribed correctly	TIAER Laboratory Manager and TIAER Laboratory QAO
LOQs consistent with requirements for Ambient Water Reporting Limits	TIAER Laboratory QAO and TIAER Laboratory Manager
Analytical data documentation evaluated for consistency, reasonableness and/or improper practices	TIAER Laboratory QAO and TIAER Laboratory Manager
Analytical QC information evaluated to determine impact on individual analyses	TIAER Laboratory QAO and TIAER Laboratory Manager
All laboratory samples analyzed for all parameters	TIAER Laboratory QAO and TIAER Laboratory Manager
Data Set Review	Responsibility
The test report has all required information as described in Section A9 of the QAPP	TIAER Project QAO and TIAER Project Manager
Confirmation that field and lab data have been reviewed	TIAER Laboratory Manager and TIAER Field Operations Supervisor
Data set (to include field and laboratory data) evaluated for reasonableness and if corollary data agree	TIAER Project QAO and TIAER Project Manager
Outliers confirmed and documented	TIAER Project QAO
Sampling and analytical data gaps checked and documented	TIAER Project QAO and TIAER Project Manager
Verification and validation confirmed. Data meets conditions of end use and are reportable	TIAER Project QAO and TIAER Project Manager

Section D3: RECONCILIATION WITH USER REQUIREMENTS

Data produced in this project, and data collected by other organizations (e.g., BRA, TCEQ), will be analyzed and reconciled with project data quality requirements. Data meeting project requirements will be used in the implementation of the Lampasas River WPP and will be submitted to TCEQ SWQMIS. Data associated with samples coded with RT as the monitoring type in the project's Event Files will be considered as appropriate for use in the development of the biennial Texas Integrated Report for Clean Water Act Sections 305(b) and 303(d).

Appendix A: Sampling Process Design and Monitoring Schedule

Sample Design Rationale

The sample design is based on the intent to characterize water quality conditions in support of the implementation of the Lampasas River WPP and is a continuation of monitoring conducted under TSSWCB projects #13-09, 16-06, and 19-54. AgriLife will summarize the data collected and conduct statistical and trend analyses to evaluate the effectiveness of BMPs implemented. Utilizing historical knowledge of the watershed, including data generated under TSSWCB projects #10-51, #13-09, 16-06, and 19-54, project participants will continue with the previous sampling plan to ensure continuity in a comprehensive water monitoring strategy within the watershed. In this project, routine and targeted biased-flow monitoring is designed to evaluate water quality during a variety of spatial, seasonal and meteorological conditions, to assess water quality with respect to effectiveness of best management practices implemented. The water quality data and evaluations of water quality conditions will be communicated to the public and the Lampasas River Watershed Partnership Steering Committee to support adaptive management of the Lampasas River WPP and expand public knowledge on Lampasas River water quality data. All monitoring data will be submitted to TCEQ SWQMIS, making routine data available for future water quality assessments of the Lampasas as addressed by the TCEQ as part of their biennial Integrated Report.

Site Selection Criteria

This data collection effort involves monitoring routine water quality using procedures consistent with the TCEQ SWQM program and includes data entry into the statewide database maintained by the TCEQ. To this end, some general guidelines were followed when selecting sampling sites, as basically outlined below and discussed thoroughly in the *TCEQ Surface Water Quality Monitoring Procedures*. Overall consideration was given to accessibility and safety. All monitoring activities were originally developed for the TSSWCB project #13-09.

1. Locate stream sites so that samples can be safely collected from the centroid of flow. Centroid is defined as the midpoint of that portion of stream width which contains 50 percent of the total flow. If few sites are available for a stream segment, choose one that would best represent the water body, and not an unusual condition or contaminant source. Avoid backwater areas or eddies when selecting a stream site.
2. Because historical water quality data can be very useful in assessing use attainment or impairment, sampling stations with current or past monitoring data have higher preference in selection criteria.
3. Routine monitoring sites were selected to bracket sources of pollution, influence of tributaries, changes in land uses, and hydrological modifications.

Sites should be generally accessible. Flow measurements will be made during routine and targeted monitoring visits.

Monitoring Sites

The Monitoring Frequency Table for TSSWCB project #19-54 is presented below as Table Appendix A.1

Legend for Table Appendix A:

TA = Texas Institute for Applied Environmental Research

RT = Program code for routine mainstem samples

BFBA = Program code for samples biased for flow conditions

RT and BFBA samples for the 10 routine and biased flow stations are to include:

Bacteria = *E. coli*

Conventional = total suspended solids, nitrate nitrogen, total phosphorus, total Kjeldahl nitrogen (RT samples will also include chlorophyll-a and pheophytin.)

Flow = flow, flow method (collected by gage, electric, mechanical or Doppler), and estimated flow severity. Note: If pooled or dry, flow method will not be reported.

Field = pH, water temperature, specific conductance, dissolved oxygen, Secchi depth

If conditions are pooled, the following pool parameters will be reported:

Maximum pool width at time of study, maximum pool depth at time of study, pool length, and % pool coverage in 500 meter reach.

Parameters reported if conditions are dry will be flow severity (reported as no flow), and days since last significant precipitation. Flow (parameter code 00061) will not be reported if the stream is dry.

Table Appendix A.1. Monitoring stations and frequency of monitoring.

1. Biased flow samples will be collected once per quarter under wet weather conditions if present. However, if routine samples are collected during wet weather conditions, an additional biased flow sample does not need to be collected that quarter. If there is a lack of wet-weather conditions in a given quarter for biased flow sampling, more than one biased flow event may occur in a subsequent quarters as coordinated between the TIAER and AgriLife Project Managers.

Sample Acceptance Policy: TIAER retains the right to refuse acceptance of any sample and return any and all portions of samples to the client. Samples submitted with little holding time remaining may not be analyzed in time to meet project requirements. Samples should have at least 50% of holding time remaining when submitted. Unless otherwise agreed upon in writing, Client should submit samples collected and preserved in accordance with 40 CFR 136, the 2009 NELAC Standard, or other regulatory requirement stated by the Client's project. TIAER Lab shall not be responsible for data accuracy on samples improperly collected, preserved or submitted. Samples not appropriately collected, preserved or submitted may be accepted and analyzed by the TIAER Lab at the request of the Client. Unless previously arranged, normal sample acceptance hours without premium fees are Monday-Friday, 0800-1600, exclusive of official Tarleton holidays. Samples submitted outside of the normal hours may be processed at a premium surcharge. By signing to relinquish the sample(s) above, the Client or Client's representative hereby agrees to this policy & conforms to Contract or Cooperative Agreement between Client and TIAER. TIAER Lab will not accept radioactive samples that exceed 250 µR/hr on a survey meter, human tissue or fluids, known biohazards, dioxin or furans without previous written authorization.
